

Jenkins, Git and GitHub

- Explain the process of working on a project in group - View [here](#)
 - Check-ins the code to Central Repository Server
 - Checkouts to the local machines
 - Modify or fix the code and check-ins as version 2 and so on.
 - Updates the local code with the latest code in Central Repository Server
 - Best practice to follow while working in a real time project
 - As everyone is working on the same code and making the changes, there is a problems of build failures and will be very difficult to identify when the build failure occurred and after who modified the code and etc.
 - To overcome the above problem, we have to use the combination of **Jenkins, Git and GitHub** for achieving continuous integration, collaboration and version controlling.
