Data Driven Framework (Continued)

- Create 'projectconfig.properties' file under 'src/test/resources' source folder , provide the paths for Zoho.xlsx and driver executables and provide the URL of the application - View here

- Create a new Class 'BaseTest.java' under the 'base' sub package of 'src/test/java' source folder and provide a reusable method to load the Properties files - View Here
- Create a test say 'LoginTest.java' and create a method say init() with @BeforeClass annotation and directly call the initialise() method by making BaseTest.java as parent class - View here

- Create a DataProvider method say getData(), which retrieves the data from an excel file - View here
  - Get the path of the Excel file from projectconfig.properties file
  - Create an object for MyXLSReader Class to call its constructor 'MyXLSReader()'
  - Call the getTestData() static method of DataUtil class and return the Object Array
